

(TEMP)

Documentation

This is a fun small project for the linux terminal, and should be taken with light fun!

(Note: Windows and MacOS versions coming soon?)

Files Setup (Important)

To Start off, Files. You need to have the Engine inside your folder with 2 main files.

main_setup.RR and **main_draw.RR**

Those allow you to write code for RedRot in lua.

Setup will execute once.

Draw will execute until the program ends.

API

- There's 2 palette colors you can use "HighMode" or "LowMode", one downside. You can only use them one at a time. Can't use both.

HighMode: 8 - colors

LowMode: 8 - colors

You can Access either one by using **RedRot.setColor(Pal)** - Low Colors
0 => High Colors 1

- The RedRot engine is completely simple to use here are some of the variables, functions and more!

Problems: a lot of bugs! and not many functions.

Screen

- **RedRot.initScreen(pickSize)** # This initialize the terminal screen => pickSize allows 3 different screen sizes 0 = **(24x24)** 1 = **(32x32)** 2 = **(36x36)** 3 = **(56x56)**

- **Palettes[color_names]** # this is a variable to.. **COLOR TEXT!** Or **ANYTHING!**. The colors 1 - 16 names you can find at the end of the documentation.
- **RedRot.drawScreen()** # This allows you to see the Graphics on the Screen.
- **RedRot.drawDebugScreen()** # This print's the screen data out (not all tho)
- **RedRot.clear()** # This clears the Screen.
- **RedRot.setPixel(x, y, color)** # It draws a pixel on screen within the screen area. x and y positions and [colors] are from palette 1 - 16 numbers. The colors 1 - 16 or names you can find at the end of the documentation.
- **RedRot.setText(x, y, String, color_name)** # allows you to display text on the screen and place it anywhere x and y positions and [color_name] is basically the name of the colors 1 - 16 names you can find at the end of the documentation.

Input

- **RedRot.keyboardInput()** # This allows keyboard input for using your keyboard! Example: (key = RedRot.keyboardInput(); if(key == "a") then RedRot.setText(5,5,"Hello, World!", "Red"); end)

Sprites

- **RedRot.SpriteData(...)** # Allows you to draw and manipulate and create your "Sprite". (x , y, [colors] ...) + how many times
- **RedRot.Sprite(x, y)** # Allows you to move your sprite around

Palette Colors / Numbers

Palette 1 - Low Colors

- 1 Black
- 2 Red
- 3 Green
- 4 Yellow
- 5 Blue
- 6 Purple
- 7 Cyan
- 8 White

Palette 2 - High Colors

- 9 HighBlack**
- 10 HighRed**
- 11 HighGreen**
- 12 HighYellow**
- 13 HighBlue**
- 14 HighPurple**
- 15 HighCyan**
- 16 HighWhite**

Music/bitchips # Coming Soon

And you're done!
OK! Have fun coding!

(Version 0.0.1)

Golden Productions !
